TITLE: The Effect of a Surface-Active Medium on Hardness Changes of Polycrystalline Metals Subjected to Cold Hardening

PERIODICAL: Uch. zap. Petrozavodskogo un-ta, 1957 (1958), Vol. 5, No. 4,
pp. 122 - 139

TEXT: The authors studied the effect of various surface-active substances on changes in microhardness H_{μ} of brass, bronze, Al and steel. Solutions of different concentration of olein and stearin acids in pure vaseline oil were used as surface-active substances. Cold hardening of specimens was performed with a striking pendulum. It is shown that as a result of the effect of surface-active substances in cold hardening H_{μ} increases; H_{μ} of cold hardened metals decreases under the effect of the surface active substances at the three initial oscillations of the pendulum. All the dependence curves of H_{μ} on the number of pendulum os-

TITLE: Transformation of austenite into ϵ -phase at low temperatures

SOURCE: Fizika metallov i metalloved., v. 17, no. 1, 1964, 49-55

TOPIC TAGS: austenite, austenitic transformation, epsilon phase, G19 iron, steel, iron, gamma epsilon transformation, supercooled austenite

ABSTRACT: Experiments were performed to determine the possibility of a complete supercooling of austenite, to study the isothermal formation of ϵ -phase at low temperatures, and to clarify the effect of heating and cooling rates on the γ - ϵ transformation. The test specimens were made of G19 iron containing (in %) 19.1 Mn, 0.05 C, 0.20 Si, 0.034 P, and 0.014 S. This metal was melted in a 50-kg induction furnace and was cast into ingots which were homogenized for 10 hours at 1150C and rolled into rods 6 mm in diameter (tempered at 1150C). A dilatometer provided with a photographic recording device and a thermostat was used in the tests. The temperatures of -40, -50, -90, -140, -160, and -180C, at which the

Card 1/3

ACCESSION NR: AP4013093

samples were held isothermally, were attained with dry ice, liquid nitrogen, and a mixture of acetone with nitrogen. To stabilize their austenite, the samples were heated to 950C and then subjected to 25 heating-chilling cycles between 400C and -196C. Experiments proved that γ - ξ transformation may progress in isothermal conditions, provided that the nonisothermally formed ξ -phase is absent. In given temperature intervals the transformation started after incubation periods the length of which depended on the cooling temperature. Figure 1 of the Enclosure shows the rates of transformations at various temperatures. Studies of the temperature-transformation rate relationship proved that the rate reached its maximum at -90C. At a relatively low starting temperature for the γ - ξ transformation and at a rapid rate of chilling it was found possible to supercool the austenite either partly or fully. Under these conditions the ξ -phase could be produced in the course of heating a sample. The rate of cooling and heating proved to exert a substantial influence on the progress of the transformation, with the low rates leading to a more complete effect (for the influence of the rates of heating and cooling on the dilatometric effect of the γ - ξ transformation see Fig. 2 of the Enclosures). The ξ -phase produced before the start of an isothermal period served as an activator in the isothermal transfor-

Card 2/5-3

ACCESSION NR: AP4013093

mation, as did the lowering of the heating rate down to a certain point. Further diminishing of the rate, however, slowed the process. The γ - ξ transformation exhibited all the features of usual phase transformations and should not be regarded as an athermal process. Orig. art. has: 6 graphs and 4 equations.

TITLE: Phase transformation and strengthening of iron-manganese-molybdenum and iron-manganese tungsten alloys during plastic deformation

SOURCE: Fizika metallov i metallovedeniye, v. 18, no. 3, 1964, 423-427

TOPIC TAGS: high manganese steel, C₁₉* steel, molybdenum containing steel, tungsten containing steel

ABSTRACT: The effect of molybdenum and tungsten on the phase transformation and strength of C₁₉* (19% Mn) steel has been studied. It was found that this steel, containing up to 4.2% Mo or up to 4.1% W and quenched from 1150C, has an austenitic structure with a small quantity of E-phase; at a Mo content of 6.3%, the structure becomes fully austenitic. Both molybdenum and tungsten were found to impede the formation of E-phase and to promote the formation of α -phase under the effect of plastic deformation. The E-phase forms mainly at lower reductions of up to 4 to 6%, while an intensive formation of α -phase begins at reductions of 15-20%. The plastic deformation raises the temperature range of the E to γ transformation, lowers the temperature of the beginning of the γ to E transformation, and reduces

Card 1/3

*C₁₉ designation should be G19 designation.

L 16309-65
ACCESSION NR: AP4046093

the dilatometric effects of direct and reverse transformations. Both Mo and W lower the modulus of strain hardening of the G19 steel at low reductions but have little effect at high reductions. Both elements lower the yield strength and hardness of the G19 steel but increase the ductility, and especially the notch toughness, at subzero temperatures (see Fig. 1 of the Enclosure). Orig. art. has: 5 figures and 3 tables.

Nekrasov-Conference (Nekrasovskaya konferentsiya)

PERIODICAL:

Vestnik Akademii nauk SSSR, 1959, Nr 4, pp 128-129 (USSR)

ABSTRACT:

From January 27 to 30, the due All-Union Conference took place in Novgorod. It was convened by the Institut Russkoy literatury (Pushkinskiy Dom) (Institute of Russian Literature (Pushkin House)) and the Institute of the Mirovaya literatura Akademii nauk SSSR (Institute of Universal Literature of the Academy of Sciences of the USSR) as well as by the Leningradskoye otdeleniye Soyuzs Sovetskikh pisateley (Leningrad Department of the Association of Soviet Writers), and the Novgorodskiy pedagogicheskiy Institut (Novgorod Pedagogical Institute). The Conference was attended by scientists and writers of a number of cities. A. M. Yegolin spoke on the "Lyric Poetry of the Poets of the Nekrasov School of the Sixties and Seventies". V. G. Bazanov spoke about the poem "Who Has a Good Life in Russia" in the light of political peasant eloquence. D. D. Blagoy dealt with "N. A. Nekrasov's Lyric Love Poetry", N. V. Os'makov spoke on "Nekrasov and the Revolutionary Narodniki Movement". The report of N. L. Stepanov who was absent

Card 1/2

SOV/30-59-4-39/51

Nekrasov-Conference

"On the Problem of the Depiction of Characters in Nekrasov's Poetry" was read. A. V. Popov reported on "Nekrasov and Novgorod kray". G. A. Remenik spoke on "Nekrasov and Soviet Poetry". The following reports were heard: B. O. Korman (Borisoglebsk) "On the Dramatization of the Lyric Monologue in the Lyric Love Poetry by Tyutchev and Nekrasov". V. G. Lartsev (Samarkand) on "The Style of Lyric Poetry in Nekrasov's and Mayakovskiy's Works". V. G. Prokshin (Ufa) on "The Style of the Poem 'Sovremanniki' by Nekrasov". B. D. Udintsev (Moscow) on "N. A. Nekrasov and D. N. Mamin-Sibiryak". L. A. Il'in (Kalinin) on an "Unpublished Poem by S. D. Drozhzhin, Dedicated to Nekrasov". O. K. Andriyenko (Minsk) on "Artistic Translations of Nekrasov by Ya. Kupala". P. P. Dubrovina (Arzamas) - "Observations Made on the Basis of Grammatical Means Employed for the Expression of Ideas by Nekrasov in His Poetry". Ye. Z. Litovchenko (Novgorod) on "Nekrasov and Shevchenko". The next Nekrasov-Conference was scheduled to take place on January 1960 in Kostroma.

TITLE: Thermal analysis of the sodium borohydride-hydrazine system
SOURCE: AN SSSR. Doklady, v. 164, no. 4, 1965, 809-811
TOPIC TAGS: hydrazine, sodium compound, boron compound, borohydride, hydrazine compound, phase diagram
ABSTRACT: Phase equilibria in the sodium borohydride-hydrazine system were studied in the range from -120 to 80C by the differential-thermal method, at concentrations from 0 to 85.5 wt. % NaBH₄. Both heating and cooling curves were plotted, and the results are shown in

L 7760-66

ACC NR: AP5025863

Fig. 1. Four compounds were observed: $\text{NaBH}_4 \cdot 2\text{N}_2\text{H}_4$, $2\text{NaBH}_4 \cdot \text{N}_2\text{H}_4$, $\text{NaBH}_4 \cdot \text{N}_2\text{H}_4$, and $\text{NaBH}_4 \cdot 6\text{N}_2\text{H}_4$, and the corresponding thermal effects are discussed. The marked supercooling of mixtures of the system and the exothermic effect on the heating curves lead to the assumption that during cooling, the system as a whole tends toward a nonequilibrium crystallization; for this reason, in plotting the phase diagram, the authors determined the transition points from heating curves instead of cooling curves. The paper was presented by Academician I. I. Chernyayev 24 Mar 65. Orig. art. has: 1 figure.

TITLE: Phase diagram of the $\text{NaBH}_4\text{-NH}_3$ system

SOURCE: Zhurnal neorganicheskoy khimii, v. 11, no. 2, 1966, 415-419

TOPIC TAGS: phase diagram, thermal analysis, boron, ammonia, hydride, melting point

ABSTRACT: The present work is a continuation of an earlier investigation of the $\text{NaBH}_4\text{-NH}_3$ system by the author, with the difference that the temperature range in this case is -25.0 to -100°C instead of 25.0 to -49.8°C . An NaBH_4 of 99.5% purity was used. The saturation vapor pressure of desiccated, purified NH_3 at -49.8 and 40.0°C was 310 and 539 mm Hg, respectively. Equilibria of the sodium borohydride -- ammonia system were investigated by the method of differential thermal analysis, and a phase diagram of the system was constructed (Figure 1). The time-temperature and the time-temperature gradient curves were recorded by EPP-09 and PSR-01 automatic potentiometers, especially adapted for this purpose, and by a chromel-copel thermocouple. The hot junctions of the thermocouple were placed in a Dewar vessel filled with melting ice. The standard used was $\text{SiH}(\text{OC}_2\text{H}_5)_3$, which freezes at -170°C . The cooling rate was $1\text{-}2^\circ\text{C}$ per minute. A schematic diagram of the apparatus used to record the cooling curves is given. The amount

TITLE: All-Union Conference of Foundry Workers (Vsesoyuznoye soveshchaniye liteyshchikov)

PERIODICAL: Mashinostroitel', 1958, Nr 5, p 48 (USSR)

ABSTRACT: At the end of 1957, an All-Union conference took place in Moscow on scientific research in casting. After the plenary session the meeting broke up into the following 5 sections: iron casting, steel casting, technology of the casting form, non-ferrous casting, and equipment. A total of 45 reports were given. Representatives of the satellites also participated. V.M. Shestopal, Candidate of Technical Sciences (Giprostanok) reported on "The Latest in Projects of Foundry Shops and Plants". I.P. Yegorenkov, Candidate of Technical Sciences reported on "The Latest in Projects of Casting Machines". N.G. Girshovich, Professor and Doctor of Technical Sciences (LPI imeni Kalinin) reported on the important research work being accomplished in determining the continuity of solidification of castings. A.F. Landa, Professor, Yu.A. Litvintsev, Engineer and Florin of the Moskovskiy institut khimicheskogo mashinostroyeniye (Moscow Institut of Chemical Machine Build-

Card 1/3

ing) reported on increased corrosion resistance and heat resistance of high-test iron with ball-shaped graphite. A.Ye. Krivosheyev, Professor of the Dnepropetrovskiy metallurgicheskiy institut (Dnepropetrovsk Metallurgical Institute) reported on "The Crystallization of Chilled Iron". B.S. Mil'man, Candidate of Technical Sciences (TSNIITMASH) reported on "The Formation of Ball-Shaped Graphite and Prospects for Receiving High Test Iron". N.D. Titov, Candidate of Technical Sciences (Automobile Plant imeni Likhachev) reported on "Conveyor Mass Production at ZIL". G.I. Kletskin, Candidate of Technical Sciences (Stankolit) spoke on "Improvements of the Process of Melting Iron in Cupola Furnaces". N.V. Gel'perin, Candidate of Technical Sciences (NII TSKhM) reported on "Production of Crank Shafts for Tractor and Harvester Engines". I.N. Frolov, Engineer of the Barnaul'skiy kotel'nyy zavod (Barnaul Boiler Plant) reported on the centrifugal casting of important iron and steel parts. Ye.M. Baturin, Engineer, reported on "Risers in Exothermic Heat Treatment". N.Ya. Kogan, Engineer, (VPTI, GLAVNIIP at GOSPLAN USSR) reported on "A New Technology of Producing Large Castings in Mechanized

Caissons". N.N. Belousov, Candidate of Technical Sciences and A.A. Dodonov, Engineer, K.G. Kovvi and Z.G. Mednikov talked about casting under pressure by using a vacuum. G.S. Taburinskiy, Engineer (NIILITMASH) reported on automatic machines for shell moulds and cores. The work of the conference will be published in 1958.

COVERAGE: The transactions of the Second Conference on the Over-All Mechanization and Automation of Industrial Processes, September 25-29, 1956, have been published in three volumes. This book, Vol. I, contains articles under the general title, Hot Working of Metals. The investigations described in the book were conducted by the Sections for Automation and Hot Working of Metals, under the direction of the following scientists: casting - P.N. Aksenov, D.P. Ivanov and G.M. Orlov; forming - A.I. Tselikov, A.D. Tomlenov and V.T. Meshcherin; welding - G.A. Nikolayev, B.I. Frolov and G.A. Maslov. There are 183 references: 142 Soviet, 34 English, 6 German, and 1 French.

AUTHOR: Yegorenkov, I. P.

TITLE: Standardization and normalization in foundry production

PERIODICAL: Standartizatsiya, no. 2, 1961, 21-25

TEXT: The Nauchno-issledovatel'skiy institut liteynogo mashinostroyeniya i liteynoy tekhnologii (NIILITMASH) (Scientific Research Institute of Foundry Machinery and Technology) as basic organization conducts the standardization and normalization in the field of foundry production, i.e., of molding materials, foundry machines and production equipment for foundries. Single sand-mold casting remains the main process for the manufacture of castings. At present, 13 million tons of castings are produced in the USSR annually (reaching the level of the USA). The NIILITMASH was already established in the thirties as "Soyuzformlit'ye". The first two standards for molding sand were elaborated in 1943/44, and then re-edited in 1946 and 1949. Casting loam was standardized in 1946 and the methods for its laboratory test in 1947. In 1950, the standardization of a new group of binding agents for molding materials (mainly

Card 1/4

Standardization and normalization...

S/028/61/000/002/005/006
B116/B206

synthetic binding agents) was started: ГОСТ 8890-58 (GOST 8890-58) for powdery material on the basis of high-melting wood pitch, ГОСТ 8830-58 (GOST 8830-58) for binding agents from clay emulsion on the basis of sulfite waste liquor. For the auxiliary molding materials, only the ГОСТ 9077-59 (GOST 9077-59) for pulverulent quartz has been introduced. In order to prevent sintering, specific molding mixtures are to be elaborated. A special branch of machine construction for foundry machines is at present being developed in the USSR. ГОСТ 7020-54 (GOST 7020-54) for molding machines is already obsolete. The NIILITMASH is preparing a new project. The TsKB NIILITMASH designed a molding machine of 20 t capacity (type 237). It is built at the Novosibirskiy zavod liteynykh mashin (Novosibirsk Plant of Foundry Machines). ГОСТ 7476-55 (GOST 7476-55) for centrifugal sand-molding machines, and ГОСТ 8907-58 (GOST 8907-58) for core blowing machines have also been elaborated by the NIILITMASH. Prototypes of the machines for cores of up to 100 kg are already available. The following products were standardized in the period from 1957 to 1960: polygon revolving screens (ГОСТ 9201-59 (GOST 9201-59)), centrifugal pug mills (ГОСТ 8664-57 (GOST 8664-57)), pug mills with vertically rotating runner stones (ГОСТ 9313-59 (GOST 9313-59)), continuous

Card 2/4

Standardization and normalization...

S/028/61/000/002/005/006
B116/B206

bucket mixers (ГОСТ 9535-60 (GOST 9535-60)), bucket sand aerators (ГОСТ 8749-58 (GOST 8749-58)); in the period from 1956 to 1959: mold breaking machines and cleaning machines. Pressure casting machines were standardized, (ГОСТ 7928-56 (GOST 7928-56)), but the vertical types of these machines were not successful as compared with the horizontal ones of this type. The production of vertical machines has, therefore, been stopped in 1960, while ГОСТ 8532-57 (GOST 8532-57) was elaborated for the horizontal ones which will, however, be improved. For latest processes ГОСТ 9311-59 (GOST 9311-59) was introduced for machines producing shell half-molds, and ГОСТ 9312-59 (GOST 9312-59) for machines producing shell cores. ГОСТ 9451-60 (GOST 9451-60) was elaborated and approved for chill casting machines. Foundry machines are designed and manufactured in accordance with the standards for machine tools. Assemblies and individual parts of foundry machines are not standardized. This is to be achieved by 1964. Apart from the NIILITMASH, 7 plants, 8 institutes, and 2 central design offices participate therein. The sorting out of obsolete standards for molding boxes, casting bevels and core marks was started in 1957. In 1957/58, the NIILITMASH elaborated machine construction standards for the classification and designation of tools and devices in machine construc- ✓

Card 3/4

Standardization and normalization...

S/028/61/000/002/005/006
B116/B206

tion. They were published in 1960. In 1958/60, the NIILITMASH determined the demand of the industry for chaplets, elaborated consumption standards, laid down the necessary amount of steel grit for the cleaning of castings, calculated the demand for welded molding boxes from special rolled stock, and handed over all these data to the Gosplan SSSR (Gosplan USSR) and the Komitet standartov, mer i izmeritel'nykh priborov (Committee on Standards, Measures, and Measuring Instruments). Standards are being elaborated for sand blasting nozzles, wooden patterns, wooden core boxes, pouring systems for casting in shell molds, and accuracy standards for wooden patterns. Molding boxes for automatic molding machines are to be standardized in 1961. From 1957 to 1958, the NIILITMASH studied the micro- and macro-relief of casting surfaces. There is 1 table.

TITLE: Turbine flowmeter. Class 42, 168903

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 5, 1965, 77

TOPIC TAGS: flowmeter *W*

ABSTRACT: This Author Certificate presents a turbine flowmeter containing a driving impeller with electric drive, a driven impeller connected to the case of an elastic element whose rotation angle measures the flow, and an impeller rotation angle meter. To exclude the possibility of moisture condensation in the cavity of the impeller rotation angle meter for flow measurement of a medium at low temperatures, the rotation angle meter connected to the driven impeller by a magnetic clutch is contained in a hermetic vacuum chamber which is placed in the flow.

TITLE: Increasing the power of VVR-S reactors

SOURCE: Moscow. Institut atomnoy energii. Doklady, IAE-993, 1965. O povyshenii moshchnosti reaktorov VVR-S, 1-17

TOPIC TAGS: water cooled nuclear reactor, water moderated reactor, reactor fuel element, nuclear reactor power / VVR-S water cooled nuclear reactor

ABSTRACT: The authors consider the possibilities for using slightly modified MR fuel assemblies for increasing the power of VVR-S water-cooled water-moderated reactors. A figure is given showing the construction and dimensions of the MR fuel assembly. The assembly consists of five tubular fuel elements of circular cross section. The heat-transfer area of the MR fuel assembly is 2.35 times as great as assemblies using EK-10 elements. The elements are interchangeable, i.e. they may be

Card 1/2

L 24710-66

ACC NR: AT6008415

placed in any cell of the reactor core. The efficient design of the MR elements assures that 90% of the water passing through the core flows through the fuel assembly. The assembly contains 173 grams of U-235, i.e. 35% more than an assembly with EK-10 elements. The use of these elements makes it possible to irradiate specimens in experimental channels or ampules with an outside diameter of 14 mm. Larger specimens may be irradiated by using fuel assemblies with fewer tubular fuel elements. However, use of the MR fuel assembly cuts down the volumetric fraction of water in the reactor core to 0.65 as against 0.7 when assemblies with EK-10 elements are used. The volumetric water fraction is cut still further to 0.52 by the use of beryllium moderators to reduce nonuniformity in heat release due to localized increases in neutron density in the water spaces between adjacent MR fuel assemblies. The use of these fuel assemblies increases the power of the reactor to 8-11 Mw and the maximum neutron intensity (U-235) to $\sim 9 \cdot 10^{13}$ neutrons/cm² sec. The authors discuss the experimental possibilities of the VVR-S reactor with MR fuel assemblies. Orig. art. has: 6 figures, 1 table.

TITLE: Remodeling the IRT reactor at the Institute of Atomic Energy imeni I. V. Kurchatov

SOURCE: Moscow. Institut atomnoy energii. Doklady, IAE-992, 1965. Rekonstruktsiya reaktora IRT v IAE im. I. V. Kurchatova, 1-25

TOPIC TAGS: nuclear reactor, reactor fuel element, nuclear reactor core

ABSTRACT: The authors describe steps taken to redesign the IRT reactor at the Institute of Atomic Energy. The following units and systems were altered to increase the power of the reactor, expand its range of experimental possibilities, and improve its operational qualities: 1. fuel elements and reactor core design; 2. cooling system; 3. experimental units; 4. control and shielding system; 5. radiation-monitoring system; 6. special ventilation. Figures are given showing the

Card 1/2

L 24711-66

ACC NR: AT6008414

longitudinal and transverse cross sections of the reactor as well as detailed diagrams of the reactor core and the channel for the "cold" neutron source. The new fuel assemblies have nearly twice as much heat-transfer area as the rod elements formerly used. Each assembly contains 155 grams of 36% enriched U-235. Metallic beryllium is used as the reflector. The core contains 54 cells in all and has a 50 mm lead shield for stopping γ -radiation. The experimental units include horizontal and vertical channels as well as a "cold" neutron source and a thermal neutron "trap". The modifications made in the reactor give a maximum thermal neutron flux (U-235) in the core of $5 \cdot 10^{13}$ neutrons/cm² sec, a maximum fast neutron intensity ($E > 0.5$ Mev) of $9 \cdot 10^{13}$ neutrons/cm² sec, and a power of 4000-5000 kw. The procedure used for disassembly and reassembly operations in the reactor pool is described. Some of the physical and technical characteristics of the modified IRT-M reactor are tabulated. Orig. art. has: 10 figures, 3 tables.

TITLE: Experience in operation of the MR reactor and tests of fuel elements and materials

SOURCE: Moscow. Institut atomnoy energii. Doklady, no. 991, 1965. Opyt eks-
pluatatsii reaktora MR i provedeniye ispytaniy TVEL i materialov, 1-44

TOPIC TAGS: nuclear research reactor, reactor fuel element, nuclear reactor
material, nuclear reactor characteristic

ABSTRACT: The authors discuss the loop research reactor MR constructed at the
Kurchatov Institute of Atomic Energy and intended for the test of fuel elements
and materials in new atomic installations. It is described in paper P/323 of the
Third Geneva Conference in 1964. The present article describes in detail its con-

Card 1/2

struction and the various test loops in it. The section headings are: I - Introduction. II. Operation of reactor. 1. Certain physical characteristics of the reactor. a) Fuel burnup. b) Efficiency of control valves, scram rods, and movable fuel assemblies. c) Fluxes of thermal and fast neutrons. 2. Control and protection system of the reactor. 3. Technological systems of the reactor. a) Cooling loop for fuel element assembly. b) Cooling loop for the reactor assembly blocks. c) Intermediate (second) cooling loop of reactor. d) Third cooling loop of reactor. e) Water purification system. 4. Fuel assembly operating conditions and conditions for the graphite stacking blocks. 5. Reloading operations. III. Operation of loop installations. Organization and performance of tests on fuel elements and materials. IV. Dosimetric control. Radiation shielding of reactor. The reactor has been in operation since 24 July 1964, and its power has been gradually increased from the initial 20 MW to 30 MW. The usual operation is at 25 MW. The reactor has 3 loop channels with 7 associated experimental channels. Various characteristics of the reactor at different power ratings are tabulated. Major contributions to the adjustment of the MR reactor were made by A. Ye. Alekseyev, B. A. Alekseyev, S. N. Begichev, A. B. Bugayenko, Yu. I. Kovalev, V. K. Lebedev, A. M. Rotankov, V. D. Rusov, N. V. Sarychev, Ye. S. Chernorotov, and Yu. A. Shikov.

characterized and the reasons for unsuccessful forest belts are analyzed. It is stated that the *Larix sibirica* Lab., *Pinus silvestris* L., *Betula verrucosa* Ehrh., *Fraxinus viridis* Mehx. and *Ulmus laevis* Pall. grow rapidly and form effective belts on common clayey chernozems. Of the species used earlier, the Norway spruce, "peristovetvisity" elm, balsam and Canadian poplars and *Elaeagnus angustifolia* L. are excluded. The characteristics of the root system of 18 species investigated are cited, by which, according to the skeletal structure of the root systems, the tree-shrub species are divided into groups: those with clearly-expressed taproots, those with taproots not clearly expressed, and species deprived of taproots. Recommendations are given for periods of conducting forest planting, and species are indicated which can be in-

SOV/130-53-7-10/35

TITLE: A Powerful Motive Force (Bol'shaya dvizhushchaya sila)

PERIODICAL: Metallurg, 1958,³ Nr 7, pp 22 - 23 (USSR).

ABSTRACT: The author describes the powerful progressive influence of "socialist rivalry" at the Kuznetsk Metallurgical Combine, both during and since its construction. The success of the combine during the war earned it many decorations and in the post-war five-year plans, it has frequently exceeded its targets. It has initiated production competitions, a recent one being in honour of the Day of the Metallurgist and the All conference of the trade unions of the USSR. The author mentions that in the first four months of this year, pig iron and steel production and steel quality have shown substantial improvements and names the following outstanding personnel: Pospelov, Ashpin, Pershikov, Pashkin, Inyutin, Silitskiy, Starkov, Chernyshev, Shabalov, Kuznetsov, Buratskiy and Slabyy. At present, the rail beam mill is competing with that at the "Azovstal'" Works. The traditional friendly rivalry with the Magnitogorskiy metallurgicheskiy kombinat (Magnitogorsk Metallurgical Combine) has proved most beneficial

Card 1/2

A Powerful Motive Force

SOV/130-58-7-10/35

(leading, e.g. to a 6-10% increase in pig-iron production through the adoption of Magnitogorsk fluxed-sinter practice). The new seven-year plan provides for the following production increases: sinter, 80%, coke 38%; pig iron, 45%, steel, 19%; rolled products, 19%; refractories, 40%. There are 2 figures.
